Dear Matchspace Music team,

I'm a fullstack developer based in Lugano, Switzerland, with a focus on TypeScript, Next.js, and payment infrastructure. When I read your job description — one engineer, full technical ownership, built from scratch — I recognised exactly the kind of work I've been doing independently for the past year.

My most relevant project is a crypto payment gateway — CryptoPay and PSP Dashboard: invoice lifecycle, webhook delivery with HMAC signing, AML screening, risk-tiered operator actions (approve / hold / reject), and a full compliance audit trail — all built with NestJS, Next.js, TypeScript, and Docker. The architecture mirrors real PSP patterns, modelled after how Stripe and Circle handle payment flows.

Your stack — Next.js, TypeScript, Supabase, Postgres, Stripe — is the environment I work in daily. I have hands-on experience integrating Stripe, designing REST APIs, managing state across complex async flows, and structuring projects for long-term maintainability.

I work well independently, document my decisions, and use AI tooling (Cursor, Claude, Copilot) to move fast without cutting corners on architecture or security.

I'm available immediately and open to on-site or hybrid in Zurich.
